planet? If a hypothetical advanced civilization detects that a solar system located in another star is controlled by a planet (or multiple planets) whose Maser technology is capable of killing all life on the star, what would be the consequences? By "kill all life", I mean that the planet/s would render the star completely inhabitable. This includes any other planets, moons, etc. Note: the technology of the hypothetical civilization in this scenario is much, much more advanced than current human technology. A: If it is

as advanced as you say, it will probably take out

DisplayPort Multimedia Interface The DisplayPort Multimedia Interface (or DisplayPort MMI) is a DisplayPort port standardized in the 2.1 revision of the DisplayPort interface, described in version 1.1 of the "DisplayPort Multimedia Interface Specification Revision 1.0", and finalized on June 19, 2008. The DisplayPort MMI supports multiple audio, video and graphics streams in a single DisplayPort link. In this review, we'll explore what it

does, how it works, and how it compares to other technologies, such as HDMI and DVI. Introduction DisplayPort MMI is a proprietary specification (firmware) by the DisplayPort MMI Consortium, which was founded by a group of OEMs and System Integrators in December 2006, as an alternative to the HDMI and DVI interfaces. It is the first DisplayPort specification to be finalized and ratified by the industry. DisplayPort MMI was finalized in 2008 and is available as of version 1.1 of the "DisplayPort

Multimedia Interface Specification Revision 1.0". It is now being used by many manufacturers, allowing them to optimize their graphics cards and display ports for graphics and video applications. DisplayPort MMI is an extension of the DisplayPort 1.0 interface that was ratified in 2003 and defined in version 1.1. DisplayPort MMI is not an HDMI extension. Unlike HDMI and DVI, DisplayPort MMI does not define any set of frame sizes or resolutions. This means that the number of pixels displayed on

your screen could be increased or decreased at any moment during playback. DisplayPort MMI is based on the DisplayPort 1.0 specification, meaning that a DisplayPort MMI device supports the basic DisplayPort 1.0 functions, such as: • Video and audio interfaces • The VESA DDC standard • Power negotiation DisplayPort MMI supports four (4) video and three (3) audio interfaces.
